PDU2000 系列用户手册

MODBUS RTU 协议说明

一、协议说明

引用标准:通用MODBUS RTU协议;

底层协议: RS-485;

物理接口: 串行通讯口采用两线RS-485, 传输方式为异步、半双工方式, 先传输最低

有效位。

2、端口设置

波特率: 9600bps (出厂默认为)

数据位: 8

校验位: 无

停止位: 1

数据流控制:无

3、查询运行参数

主机发送,括号内为字节数:

从机地址(1),功能码(1),寄存器首地址(2),数据长度(2),CRC码(2)

从机应答,括号内为字节数:

从机地址(1),功能码(1),数据字节数(1),数据(N),CRC码(2)

功能码读: 03H 功能码写: 10H

4、参数读取属性表格

Register 返回的数据字节高位在前

如: Register = RegisterH*256+ RegisterL;

项目	MODBUS 地址	单位	属性	参数转换公式	返回字节数
电压值 L1	0000	V	只读	=register	2
电压值 L2	0001	V	只读	=register	2
电压值 L3	0002	V	只读	=register	2
电流值 L1	0003	A	只读	=register/10	2
电流值 L2	0004	A	只读	=register/10	2
电流值 L3	0005	A	只读	=register/10	2
功率值 L1	0006	W	只读	=register	2

功率值 L2	0007	W	只读	=register	2
功率值 L3	0008	W	只读	=register	2
频率值 L1	0009	Hz	只读	=register	2
频率值 L2	0010	Hz	只读	=register	2
频率值 L3	0011	Hz	只读	=register	2
电能值 L1	0012-0013	kWh	只读	=register/10	4
电能值 L2	0014-0015	kWh	只读	=register/10	4
电能值 L3	0016-0017	kWh	只读	=register/10	4
电压值 L1 下限告警 阈值	0018	V	只读	=register	2
电压值 L1 上限告警 阈值	0019	V	只读	=register	2
电压值 L2 下限告警 阈值	0020	V	只读	=register	2
电压值 L2 上限告警 阈值	0021	V	只读	=register	2
电压值 L3 下限告警 阈值	0022	V	只读	=register	2
电压值 L3 上限告警 阈值	0023	V	只读	=register	2
电流值 L1 下限告警 阈值	0024	A	只读	=register/10	2
电流值 L1 上限告警 阈值	0025	A	只读	=register/10	2
电流值 L2 下限告警 阈值	0026	A	只读	=register/10	2
电流值 L2 上限告警 阈值	0027	A	只读	=register/10	2
电流值 L3 下限告警 阈值	0028	A	只读	=register/10	2
电流值 L3 上限告警 阈值	0029	A	只读	=register/10	2
电压值 L1 告警标识	0030		只读	0000H 正常 0001H 下限告警 0010H 上限告警	2

电压值 L2 告警标识	0031	只读	0000H 正常 0001H 下限告警 0010H 上限告警	2
电压值 L3 告警标识	0032	只读	0000H 正常 0001H 下限告警 0010H 上限告警	2
电流值 L1 告警标识	0033	只读	0000H 正常 0001H 下限告警 0010H 上限告警	2
电流值 L2 告警标识	0034	只读	0000H 正常 0001H 下限告警 0010H 上限告警	2
电流值 L3 告警标识	0035	只读	0000H 正常 0001H 下限告警 0010H 上限告警	2
B1 空开状态	0036	只读	0000H 断开 0001H 闭合	2
B2 空开状态	0037	只读	0000H 断开 0001H 闭合	2
单相、三相标识	0038	只读	0001H 单相 0003H 三相	2
版本标识	0039	只读		2
波特率	0040	只读	0000H: 1200 0001H: 2400 0002H: 4800 0003H: 9600 0004H: 19200 0005H: 38400	2
预留	0041	只读		2

5、PDU 串口设置参数表格

从机地址(1),功能码(1),寄存器首地址(2),设置字节(2),CRC码(2);

项目	MODBUS 地址	単位	属性	参数转换公式	设置字节数
设置地址码	1000		读/写	1-99	2

设置波特率	1001	读/写	0 表示为 1200 1 表示为 2400 2 表示为 4800 3 表示为 9600 4 表示为 19200 5 表示为 38400	2
L1 电压下限阈值	1002	读/写	=register	2
L1 电压上限阈值	1003	读/写	=register	2
L2 电压下限阈值	1004	读/写	=register	2
L2 电压上限阈值	1005	读/写	=register	2
L3 电压下限阈值	1006	读/写	=register	2
L3 电压上限阈值	1007	读/写	=register	2
L1 电流下限阈值	1008	读/写	=register*10	2
L1 电流上限阈值	1009	读/写	=register*10	2
L2 电流下限阈值	1010	读/写	=register*10	2
L2 电流上限阈值	1011	读/写	=register*10	2
L3 电流下限阈值	1012	读/写	=register*10	2
L3 电流上限阈值	1013	读/写	=register*10	2

示例:

读取信息: 01 03 00 00 00 28 45 D4 ,地址+功能吗+MODBUS 地址(16 进制)+读取长度(16 进制)+CRC 校验码

设置地址: 01 10 03 E8 00 02 C1 B8 , 地址+功能码+MODBUS 地址(16 进制)+地址(需要修改的地址)+CRC 校验码

PDU2000 User Manual

MODBUS RTU INSTRICTION

Huawei Technologies Co., Ltd

1.Protocol instruction

1 Standard: Common MODBUS RTU Protocol;

Basic Protocol: RS-485;

physical interface: Serial communication port with two line RS-485, asynchronous transm

ission, half duplex transmission, and the least significant bit will take precedence.

2 Port settings

Data byte: Factory default is 9600bps

Data bit: 8

Even-odd checking: without

Stopping bit:1

Data flow controlling: without

3 Checking the operation parameter

Master sends the command. See the number of bytes indicated in parentheses: master address code(1), function code(1), register address(2), data length(2), CRC code(2).

Slave responds to the command. See the number of bytes indicated in parentheses:

slave address(1), function code(1), numbers of bit(1), data(N), CRC code(2).

Function Code reading: 03H Function Code writing: 10H

4 Parameter property

The higher numbers of bytes will be in front for register returning. For example:

Register = RegisterH*256+ RegisterL;

Item	MODBUS Address	Unit	Proper ty	Conversion formula of parameters	Returning number of bytes
------	-------------------	------	--------------	----------------------------------	---------------------------------

					1

5. PDU Serial port settings parameter table

Slave address (1), Function code (1), register address (2), data length (2), CRC Code (2);

Item	MODBUS address	Unit	Proper ties	Parameter Conversion formula	Setting number of bytes
Set the address code	1000			1-99	2
Set the baud rate	1001			0 means 1200 1 means2400 2 means4800 3 means9600 4 means19200 5 means38400	2
Voltage lower limit Threshold for L1	1002			=register	2
Voltage Upper limit Threshold for L1	1003			=register	2
Voltage lower limit Threshold for L2	1004			=register	2
Voltage Upper limit Threshold for L2	1005			=register	2
Voltage lower limit Threshold for L3	1006			=register	2

Voltage Upper limit	1007			
Threshold for L3	1007		=register	2
Current Lower limit	1008		=register*10	2
Threshold for L1	1008		_legister 10	2
Current Upper limit	1009		=register*10	2
Threshold for L1	1009		_legister · 10	2
Current Lower limit	1010		=register*10	2
Threshold for L2	1010		-register 10	
Current Upper limit	1011		=register*10	2
Threshold for L2	1011			
Current Lower limit	1012		=register*10	2
Threshold for L3	1012		-legister · 10	2
Current Upper limit	1013		_ragistar*10	2
Threshold for L4	1013		=register*10	2

For example:

Read information: 01 03 00 00 00 28 45 D4, address + function code + MODBUS address(Hexadecimal) + number of byte (Hexadecimal) + CRC code.

Setting address: 01 10 03 E8 00 02 C1 B8 address + function code + MODBUS address(Hexadecimal) + address(need to revised address) + CRC code.
